

Analyze Network Attack

Cybersecurity Incident Report

Type of Attack (See Log Below)

A Denial of Service (DoS) attack targeting the TCP handshake procedure, specifically a SYN flood attack. The logs show that there is a consistent and overwhelming number of SYN requests from the IP address **203.0.113.0**. This event could be an orchestrated effort by a malicious actor to exhaust the server's resources and deny legitimate users' access.

TCP Protocol

When website visitors try to establish a connection with the web server, a three-way handshake occurs using the TCP protocol. The three steps of the handshake are:

1. The client sends a SYN (synchronize) packet to the server.
2. The server responds with a SYN-ACK (synchronize-acknowledgment) packet.
3. The client sends an ACK (acknowledgment) packet back.

Purpose of Attack

When a malicious actor sends a large number of SYN packets all at once the server allocates resources to acknowledge these SYN requests and gets overwhelmed if the number of SYN requests exceeds its capacity to respond. The logs reveal a pattern where an unfamiliar IP address is repeatedly sending SYN requests without completing the handshake, this inundates the server's resources. Subsequently, the website became unresponsive, causing connection timeouts and preventing legitimate users, including employees, from accessing the sales webpage. Consequences include business disruption, loss of revenue, a potential drop in customer trust, and increased costs in IT resources to mitigate and prevent future attacks.

Reflection on Network Intrusion Attacks

I understand that network attacks aim to disrupt, destroy, or illicitly access network resources and data. The symptoms described in the scenario are indicative of a SYN flood attack. The primary difference between DoS and DDoS is the number of attacking sources. DoS originates from a single source, while DDoS involves multiple sources. The website is reporting a connection timeout error and is taking a long time to load because the server is overwhelmed with illegitimate SYN requests, preventing it from handling legitimate traffic.

How to Secure the Network

- Implement rate-limiting to restrict the number of SYN requests from a single IP within a specific timeframe.
- Employ Intrusion Prevention Systems (IPS) that detect and mitigate SYN flood attacks.
- Regularly update and patch systems to protect against known vulnerabilities.
- Consider using cloud-based DDoS protection services that can absorb massive amounts of traffic.
- Educate staff about cybersecurity best practices and maintain a rapid response protocol for potential threats.
